

Synchoo

A connected operating layer for shared mobility

Bring discovery, booking, payment and trip evidence together—without forcing every mobility service into the same workflow.

Clients · operating partners · strategic stakeholders

A shared operating layer. Distinct service journeys.

Synchoo connects vehicle rental, verified driver hire, car pooling and vehicle care in one role-aware marketplace with payments, trust controls and trip operations built in.

01

For customers

One account connects discovery, payment and booking records across mobility services.

02

For operators

Availability, verification and handover evidence stay attached to the relevant booking.

03

For partners

Separate service lifecycles provide a foundation for expanding supply without replacing the core product.

Fragmented journeys create operational gaps.

01

Discovery is scattered

Four distinct mobility services create fragmented journeys for customers and operators.

02

Trust loses context

Trust, availability, handover, payments and incident evidence must remain connected across every booking.

03

Operations stay separate

Synchoo brings these operational layers into one product while keeping each booking workflow independent.

Four service lines, one connected foundation.

A service-first experience, with role-aware operations.

Everything mobility, one platform

Rent a vehicle, hire a verified driver, or book a doorstep wash — pay by card or Synchoo wallet.

Rent a vehicle

Hire a driver

Vehicle wash

Synchoo wallet

Customer, host, driver and administrator experiences connect service discovery to booking records and trip operations.

CURRENT PRODUCT UI • NOT CUSTOMER ADOPTION EVIDENCE

From an available vehicle to an evidence-backed trip.

HANDOVER CONFIRMS THE EXCHANGE; IT DOES NOT REMOTELY UNLOCK A VEHICLE.

Five participants. Clear responsibilities.

Customers

Discover, book, pay, hand over, track, review and raise supported disputes.

Wash partners

Participate in an admin-coordinated service workflow with approval before payment.

Hosts

Complete verification, publish approved vehicles, manage availability, bookings and trip evidence.

Administrators

Review identity and vehicle records, coordinate washing capacity and resolve disputes.

Drivers

Create a verified profile, control availability and manage hire or pooling requests.

An application stack built around protected workflows.

SCALING REQUIRES CAPACITY TESTS, COMPLETE PAGINATION AND OPERATIONAL MONITORING.

The booking record anchors access and evidence.

- 01

Role checks and row-level policies restrict sensitive records
- 02

Verification state gates customer booking and public vehicle visibility
- 03

Payment signatures are verified on the server before confirmation
- 04

Booking membership gates messages, tracking and dispute access
- 05

Inspection photos and handover timestamps preserve trip evidence
- 06

Data export and deletion controls support user privacy operations

Define success before increasing exposure.

Illustrative pilot measures below are proposed evaluation criteria—not measured performance or commercial forecasts.

01

For customers

Pilot measure: booking completion and support requests per trip.

02

For operators

Pilot measure: approval turnaround and handover exceptions.

03

For partners

Pilot measure: partner activation and completed service requests.

Implemented capabilities are not a launch certificate.

01

Implemented

Four service lines, wallet/card payments, QR handover, verification, chat, tracking, inspections, disputes, reviews and notifications.

02

Verified in repository

Automated in-memory lifecycle simulations cover rentals, pooling, driver hire, washing and wallet scenarios.

03

Requires deployment validation

Live payment credentials, production monitoring, delivery messaging and end-to-end tests against the deployed database and UI.

No traction, revenue, market-size or customer-adoption claims are made. Repository evidence does not replace deployed acceptance testing.

Validate the foundations before the pilot opens.

Security acceptance

Complete access-control acceptance checks as customer, host, driver and administrator before opening the pilot.

Payment resilience

Validate hosted credentials, payment reconciliation, cancellation and refund outcomes, including interrupted checkout.

Real-world workflow tests

Exercise deployed bookings, overlapping availability, QR handovers, disputes and wallet balances with signed-in accounts.

Operational readiness

Complete long-list pagination, monitoring, backup/restore drills and incident ownership before scaling.

Start with a controlled pilot. Scale on evidence.

Align on service scope, supply partners and success criteria; validate security and money movement before opening wider access.

01

Agree pilot geography and service scope

02

Close security and payment release gates

03

Run real bookings with participating partners

04

Review outcomes before expanding

REVIEW THE PRODUCT AND ALIGN THE PILOT

<https://stalightride.lovable.app/pitch>

A disciplined distinction between current and proposed.

- 01 No traction, revenue, market-size or customer adoption claims are included because the repository does not substantiate them.
- 02 The existing automated suite models lifecycle rules in memory; it is not a substitute for deployed database and browser end-to-end testing.
- 03 The install experience is manifest-based; offline caching and background sync are not currently established.
- 04 Card refund execution and payment reconciliation require deployment validation across every service; cancellation UI or ledger records alone do not establish completed external refunds.
