

MOBILITY INFRASTRUCTURE, UNIFIED

One operating system for shared mobility.

Synchoo connects vehicle rental, verified driver hire, car pooling and vehicle care in one role-aware marketplace with payments, trust controls and trip operations built in.

Mobility breaks when the journey is fragmented.

Problem 1

Four distinct mobility services create fragmented journeys for customers and operators.

Problem 2

Trust, availability, handover, payments and incident evidence must remain connected across every booking.

Problem 3

Synchoo brings these operational layers into one product while keeping each booking workflow independent.

Purpose-built flows. Shared platform intelligence.

01

Vehicle rental

Search verified vehicles, schedule precise pickup and return times, pay, complete QR handover and manage the trip.

02

Driver hire

Discover licence-reviewed drivers, book by hour or day, pay after confirmation and follow a dedicated hire lifecycle.

03

Car pooling

Drivers publish routes and seats; riders discover nearby trips and submit requests that drivers accept or decline.

04

Vehicle wash

Customers request a service slot; operations confirms availability before payment and fulfilment.

From discovery to defensible handover.

- 01 Search verified inventory and select an available time window
- 02 Authenticate, confirm the booking and complete payment
- 03 Use booking-scoped chat and precise pickup location
- 04 Scan QR and record pickup inspection before trip start
- 05 Share live location during the active booking
- 06 Record return inspection, complete handover and receive a receipt
- 07 Leave a review or open an evidence-backed dispute when needed

Designed around every participant.

Customers

Discover, book, pay, hand over, track, review and raise supported disputes.

Hosts

Complete verification, publish approved vehicles, manage availability, bookings and trip evidence.

Drivers

Create a verified profile, control availability and manage hire or pooling requests.

Wash partners

Participate in an admin-coordinated service workflow with approval before payment.

Administrators

Review identity and vehicle records, coordinate washing capacity and resolve disputes.

The operational layer beneath every booking.

- Role-aware customer, host, driver and administrator experiences
- Wallet and card payment paths with ledger-backed transactions
- QR pickup and return confirmation
- Booking-scoped chat with image sharing
- Live trip location sharing for active rental bookings
- Fuel, odometer, damage and photo inspection records
- Verification queues for customers, hosts, vehicles and drivers
- Reviews, vendor responses, reports and dispute resolution
- In-app event notifications and printable booking receipts
- Self-service data export and account anonymisation controls

A focused, modern application stack.

01

Experience

Responsive React interfaces
and role-aware navigation

02

Application

TanStack Start routing, server
functions and protected
workflows

03

Platform

Postgres data, authentication,
storage, realtime events and
row-level access controls

04

Services

Razorpay payment flows and
Google Maps location
experiences

Controls built into every booking.

- Role checks and row-level policies restrict sensitive records
- Verification state gates customer booking and public vehicle visibility
- Payment signatures are verified on the server before confirmation
- Booking membership gates messages, tracking and dispute access
- Inspection photos and handover timestamps preserve trip evidence
- Data export and deletion controls support user privacy operations

Clear about what exists, and what comes next.

Implemented

Four service lines, wallet/card payments, QR handover, verification, chat, tracking, inspections, disputes, reviews and notifications.

Verified in repository

Automated in-memory lifecycle simulations cover rentals, pooling, driver hire, washing and wallet scenarios.

Requires deployment validation

Live payment credentials, production monitoring, delivery messaging and end-to-end tests against the deployed database and UI.

Foundation (Current)

Marketplace services, role-based operations, verification, payments and trip controls.

Operational hardening (Proposed)

Deployed end-to-end test coverage, observability, service-level dashboards and reconciliation tooling.

Growth systems (Proposed)

Partner onboarding automation, demand intelligence, fleet tools and controlled geographic expansion.

EVIDENCE NOTES

Limitations stated plainly.

- No traction, revenue, market-size or customer adoption claims are included because the repository does not substantiate them.
- The existing automated suite models lifecycle rules in memory; it is not a substitute for deployed database and browser end-to-end testing.
- The install experience is manifest-based; offline caching and background sync are not currently established.
- Vehicle-rental cancellation refund automation was not verified in the audited implementation; driver-hire and wash refund workflows are present.

Next step: review the live product journeys and define the deployment validation plan.
